# **Welcoming Letter**

**Dear Delegates,**

**It is both a pleasure and a great honor to welcome you to the first Fatih MOIC High School Istanbul Summit 2026. On behalf of the entire Fatih MOIC team, I would like to express our sincere gratitude and happiness to have you join us in this program. Your presence is what makes this summit meaningful, and we are truly excited to bring together such a diverse and motivated group of participants.**

**At Fatih MOIC, this platform is created for you. Our goal is to support Muslim youth in developing valuable life skills, including critical thinking, diplomacy, and effective communication. Through this program, we hope to reach and connect young individuals from all backgrounds, creating a space where ideas can be shared and perspectives can grow.**

**We encourage you to actively participate in your committees with respect, openness, and a willingness to collaborate. Engage in discussions, listen to different viewpoints, and make the most of this opportunity. We are confident that, together, we will make this summit a successful and memorable experience for everyone involved.**

**Yours sincerely,**

**Adama Serrageh Bah,**

**Secretary General.**

## Introduction to the Committee

The Digital Youth Council (DYC) Committee provides a platform for youth to shape societal outcomes in a rapidly advancing digital era. Digital technologies now directly influence communication, education, and social interaction, positioning youth as primary stakeholders rather than passive users. Global internet users exceed 5 billion, with youth aged 16–24 showing usage rates above 90% in many regions, confirming their central role in digital environments.

Delegates represent Muslim youth and analyze how emerging technologies, especially Artificial Intelligence (AI), affect development, values, identity, and behavior. The interaction between technological systems and religious identity creates measurable opportunities and risks that require structured evaluation.

The committee focuses on applying AI to improve education, intellectual growth, and social participation while addressing risks such as cultural erosion, ethical conflict, and behavioral change. Delegates must produce solutions that align technological advancement with Islamic principles and cultural continuity.

## Introduction to the Agenda

**Agenda Item:** “*Evaluating the Impacts of Artificial Intelligence on the Values, Identity, and Behavior of Muslim Youths*”

The agenda, “Evaluating the Impacts of Artificial Intelligence on the Values, and Behavior of Muslim Youths,” addresses a central global mation. Artificial Intelligence refers to systems performing tasks

requiring human intelligence, including learning, reasoning, and decision-making. AI expansion is driven by computing power, data availability, and global connectivity, with more than half of global organizations having adopted AI in at least one function.

Muslim youth are highly affected due to extensive engagement with AI-driven platforms such as social media, search engines, and educational tools. Over 5 billion people use the internet, with AI-driven recommendation systems playing a dominant role in shaping content exposure. These systems shape information access, opinion formation, and social interaction, directly influencing identity, values, and behavior.

The agenda requires evaluating both benefits and risks. AI improves education, innovation, and connectivity but introduces misinformation, algorithmic bias, and ethical conflict. These risks directly affect Muslim youth due to the intersection of digital content with faith, identity, and moral frameworks. Delegates must develop solutions ensuring responsible AI use while protecting Islamic values and strengthening international cooperation.

## Definition of Terms

**Artificial Intelligence (AI):** Computer systems performing tasks requiring human intelligence, including learning, reasoning, and decision-making, widely used in digital platforms and education.

**Algorithm:** A defined set of instructions used to process data and produce outputs, forming the operational basis of AI systems, especially in recommendations and automation.

**Digital identity:** The representation of an individual based on online activity, behavior, and data, directly influencing perception, interaction, and self-concept.

**Machine learning:** A branch of AI enabling systems to improve performance through data without explicit programming.

**Algorithmic bias:** Systematic and unfair outcomes in AI systems caused by biased or incomplete data.

## **Background Information**

Artificial Intelligence originated in the mid-20th century through research on machine-based reasoning. Its development remained limited to academic contexts during the 1980s and 1990s due to technological constraints.

The early 2000s marked a transition as internet expansion and personal computing enabled AI to move into practical applications. Growth in global data and computational power accelerated this shift. Member States of the Organization of Islamic Cooperation integrated Information and Communication Technologies into development strategies, increasing digital access among Muslim populations.

By the 2010s, advancements in machine learning, mobile technology, and big data integrated AI into daily systems. AI became standard in search engines, translation tools, education platforms, and social media. A significant proportion of content on platforms such as YouTube is driven by algorithmic recommendations, demonstrating AI control over information exposure. These systems expanded access to information and economic participation.

These developments also introduced structural risks. AI influences information distribution, social interaction, and knowledge formation, directly affecting

identity and cultural representation. While increasing access, AI raises measurable risks of bias, misinformation, and cultural distortion.

## **Current Situation (2024-2026)**

Artificial Intelligence is now a core component of global systems, with direct impact on youth behavior, education, and communication. Youth populations rely heavily on AI-driven platforms for daily activities.

Generative AI tools, including chatbots and automated writing systems, are widely used in education. A large majority of students report using AI tools in their academic work, reflecting a structural shift in learning. Educational institutions increasingly integrate AI for personalized and adaptive learning systems.

Social media platforms depend on AI algorithms to curate content, directly controlling visibility and engagement. These systems prioritize engagement metrics, often amplifying emotional or controversial material.

AI is also expanding into religious and cultural applications, providing access to religious texts, answering theological questions, and supporting language learning. These tools increase access but introduce accuracy risks due to dataset limitations, particularly dominance of English-language data.

Governments and international bodies are developing regulatory frameworks. The European Union AI Act establishes risk-based governance of AI systems. Implementation gaps remain, especially in developing regions.

For Muslim youth, AI creates both opportunity and exposure to risk. Digital environments often reflect globalized values that may conflict with Islamic principles, while algorithmic systems shape identity formation without transparency or accountability.

## **Causes of the Issue**

**AI-related challenges are driven by structural imbalances. A primary factor is dataset dominance by Western-produced content, leading to limited cultural representation and biased outputs. Low Muslim representation in AI development reduces integration of religious and cultural considerations into system design. Weak regulatory systems also allow biased or harmful AI deployment without accountability.**

**The digital divide restricts access, with internet penetration above 90% in high-income regions but below 30% in some low-income areas, increasing inequality. Platform economic models prioritize engagement and profit, optimizing algorithms to promote high-interaction content, often amplifying misinformation and polarization.**

## **Key Issues**

**Algorithmic bias produces unequal outcomes. Studies show facial recognition systems have significantly higher error rates for individuals from African and Asian backgrounds compared to white individuals. Recommendation systems control large portions of content consumption, reinforcing existing beliefs and shaping perception.**

**Content moderation is ineffective. Research by the Center for Countering Digital Hate shows 89% of reported anti-Muslim hate content remains online.**

**Educational inequality persists. AI improves learning quality but unequal access limits benefits in under-resourced regions. Privacy concerns are significant. Over 80% of global users report concern about data collection and usage.**

Labor markets are at the same time changing rapidly. A significant share of jobs face high automation risk due to AI-driven transformation, requiring workforce adaptation and new skill development.

## **Stakeholders**

Governments regulate AI, enforce standards, and expand access. Technology companies design and deploy AI systems, determining functionality and impact. Muslim youth are directly affected by both benefits and risks. Religious scholars provide ethical and theological guidance aligned with Islamic principles. Educators integrate AI into learning and prepare students for technological change. International organizations, including the United Nations and the Organization of Islamic Cooperation, coordinate global policy and cooperation.

## **Case Studies**

Artificial Intelligence presents a range of interconnected challenges that directly affect Muslim youth.

Algorithmic bias remains a major concern. Studies show facial recognition systems have significantly higher error rates for individuals from African and Asian backgrounds compared to white individuals, demonstrating systemic bias embedded in training data.

Social media algorithms further intensify these challenges. A significant proportion of online content consumption is driven by recommendation systems, shaping perceptions and reinforcing existing viewpoints.

Content moderation also presents a critical issue. Research by the Center for Countering Digital Hate found that approximately 89% of reported anti-Muslim hate content was not removed by major platforms, highlighting substantial gaps in enforcement and accountability.

**In education, AI introduces both opportunities and inequalities. While advanced tools provide personalized learning experiences, unequal access to technology limits their benefits for many students, particularly in under-resourced regions.**

**Ethical concerns are equally significant. Surveys indicate that over 80% of global internet users express concern regarding the collection and use of their personal data, raising important questions about privacy and autonomy.**

**Finally, the labor market is undergoing rapid transformation. A significant share of jobs face high automation risk due to AI-driven transformation, while many others are evolving, requiring new and advanced skill sets.**

## **Opportunities of AI**

**AI improves education through personalized learning, with studies showing measurable improvements in learning outcomes. The labor market creates new opportunities in AI-related fields, increasing demand for technical skills. AI supports broader sectors including healthcare, agriculture, and environmental sustainability, contributing to economic and social development.**

## **Role of Governments and the OIC**

**Governments play a central role in shaping how AI is developed and used. They are responsible for establishing regulations that prevent discrimination, protect user data, and ensure that AI systems operate in a fair and transparent manner. Investment in digital infrastructure and education is essential to ensure equitable access to technological advancements.**

The OIC can facilitate cooperation among member states by promoting shared standards, providing technical assistance, and ensuring that policies reflect Islamic values. Through coordinated efforts, it can help address disparities and support responsible AI development.

## **Importance of Digital Policies**

Digital policies serve as the foundation for managing the impact of AI. Effective policies must ensure transparency, require regular bias testing, and establish accountability mechanisms.

They should also protect individuals from data misuse and promote inclusivity by addressing disparities in access to technology. Without enforceable policies, ethical principles cannot be effectively implemented.

## **Possible Solutions**

Addressing the challenges associated with AI requires a comprehensive and coordinated approach. Expanding digital literacy programs is essential to equip young people with the skills necessary to navigate digital environments responsibly, including critical thinking and ethical awareness.

The development and enforcement of ethical AI regulations are equally important to ensure fairness, transparency, and accountability.

Providing training opportunities in AI and related fields enables youth to actively participate in technological development. Inclusive innovation must also be prioritized to ensure equal access for marginalized communities.

Efforts to combat misinformation remain crucial. Awareness campaigns and educational initiatives can help young people critically evaluate digital content and reduce the spread of harmful information.

## Questions

- **How should Member States define, and measure representational harm caused by AI systems?**
- **How do we fight misinformation?**
- **What role should platform, schools, and governments play in fighting misinformation?**
- **What specific functions should the OIC perform in harmonizing AI governance across Member States while respecting national sovereignty and diversity?**

- **Under what conditions should AI systems be permitted to influence high-stakes educational decisions (e.g., examinations, admissions), and what safeguards are necessary?**
- **How can international cooperation ensure smaller Member States receive technical assistance without creating dependency?**
